The Ontario
Task Force on
Employment and
New Technology

**Employment and New Technology
in Ontario's Service Sector:
a Summary of Selected Industries**
An Appendix to the Final Report

Co-Chairmen of the Task Force

WILLIAM B. BOGGS
Chairman and President, The de Havilland Aircraft of Canada Ltd.

ROBERT WHITE
Director for Canada, United Auto Workers Union

Members of the Task Force

RALPH BARFORD
Chairman, Valleydene Corporation Ltd.

JALYNN BENNETT
Investment Vice-President, The Manufacturers Life Insurance Co.

LUCIE NICHOLSON
President, Ontario Division, Canadian Union of Public Employees

FRED POMEROY
President, Communications Workers of Canada

THOMAS ARMSTRONG
Deputy Minister, Ontario Ministry of Labour

BENSON WILSON
Chairman, Ontario Manpower Commission

Staff

Richard Brown, Research Director

Stanley But Hildegard Martens

APPENDIX 12
EMPLOYMENT AND NEW TECHNOLOGY IN ONTARIO'S
SERVICE SECTOR:
A SUMMARY OF SELECTED INDUSTRIES

This Appendix contains a report prepared for the Ontario Task Force on Employment and New Technology. The topic was approved in advance by the Task Force. At the conclusion of the study, the Task Force had the opportunity to review the report, but its release does not necessarily imply endorsement of the results by the Task Force or its individual members.

Additional copies of this and other Ontario Government publications are available from:

The Ontario Government Bookstore, 880 Bay Street, Toronto for personal shopping. Out-of-town customers write to Publications Services Section, 5th Floor, 880 Bay Street, Toronto, M7A 1N8. Telephone (416) 965-6015. Toll free long distance 1-800-268-7540, in area code 807 dial 0-Zenith 67200. Master Card and Visa accepted. Cheques and money orders payable to the Treasurer of Ontario. Prepayment required.

FOREWORD

The Ontario Task Force on Employment and New Technology, a joint labour-management group, was established in May 1984 "to consider and report on the manpower and employment implications of new technologies as the same may be introduced and applied in Ontario during the next decade and the extent and nature thereof."

To inform its discussions, the Task Force established a research agenda designed to gather information on employment and technological change from a wide variety of sources. The research agenda contained projects which gathered information of a historical nature, and projects with a future orientation which were designed to gather information describing likely occupational and employment implications associated with technological change in the 1985-1995 period.

The Appendices to the Final Report of the Ontario Task Force on Employment and New Technology contain reports of these research projects. A complete list of these Appendices may be found at the rear of this document.

Among the Appendices are reports of a series of studies to assess the extent and nature of the employment implications of new technology in selected industries in Ontario. Appendix 3 describes the process by which the industries were selected, and contains the studies' terms of reference which called for particular attention to selected new technologies and occupational groups. Appendices 4-18 contain reports of these industry studies, which were conducted by Currie, Coopers & Lybrand, management consultants.

This particular appendix contains a summary of results obtained from the industries which were selected for study in the service sector.

Dr. Richard L. E. Brown, P.Eng.
Research Director

ACKNOWLEDGEMENTS

The Ontario Task Force on Employment and New Technology has been generously supported by financial contributions from:

The Board of Industrial Leadership and Development (BILD)
of the Government of Ontario.

The Ontario Manpower Commission.

The Ontario Ministry of Labour.

The Task Force would like to thank the staff of Currie, Coopers & Lybrand, particularly Maureen Farrow and Victor Rocine, whose assistance in the conduct of this study was greatly appreciated.

Special thanks are due to all industry experts and survey respondents who provided information for this study.

EMPLOYMENT AND NEW TECHNOLOGY IN ONTARIO'S
SERVICE SECTOR: A SUMMARY OF SELECTED INDUSTRIES

1.0 INTRODUCTION

This report is one of a series of industry reports which summarize the findings of a major research project¹ undertaken for the Ontario Task Force on Employment and New Technology. The report summarizes the results of the investigation into selected industries in Ontario's service sector which are:

<u>Industry</u>	<u>Standard Industrial Classification (2)</u>
Chartered Banks and Trust Companies	SIC 701
Insurance Carriers - Life and General	SIC 721
Insurance and Real Estate Brokers and Agents, (excluding Real Estate Sales Agents)	SIC 735
Federal Administration	SIC 909
Provincial Administration	SIC 931
Local Government	SIC 951
Telephone Systems (and Interconnects)	SIC 544
Telegraph and Cable Systems	SIC 545
Retail Food	SIC 631
General Merchandise	SIC 642
Computer Services	SIC 853
Offices of Management and Business Consultants	SIC 867

¹ Manpower and Employment Implications of New Technologies in Selected Service Industries in Ontario to 1995. The terms of reference of this assignment can be found in Appendix 3 to the Task Force's final report.

² 1970, Standard Industrial Classification (SIC), Statistics Canada.

1.1 Structure of This Report

This report includes four parts:

- The first part (Chapter 1.0) is this Introduction which includes a description of the approach and methodology.
- The second part (Chapter 2.0) summarizes key aspects of the historical reports prepared for each industry from 1971 to 1983 (dependent on the availability of data). More detail can be found in the historical analyses in the specific industry reports (Appendices 13 to 18).
- The third part (Chapters 3.0 to 7.0) discusses the results of the survey of firms in each industry and incorporates the discussions with the industry experts. These chapters cover:
 - a review of output and employment in each of the selected industries from 1971 to 1983,
 - a review of recent and anticipated technology adoptions in each industry,
 - the outlook for each industry to 1995, including expected output and employment levels,
 - effects on employment of new technology such as anticipated occupational shifts and changes in required skills,
 - an overview of the labour relations environment as it relates to new technology, and

- observations on planning efforts for technological change by industry.
- Part four of the report includes various appendices which support the text of individual chapters.

1.2 Study Approach

The study approach selected incorporates the following research techniques:

- analysis of published statistics and reports on the industry, augmented by the working knowledge of industry specialists within Currie, Coopers & Lybrand,
- in-depth interviews with management and labour experts in each industry, conducted at various stages in the project, using structured interview guides, and
- a survey of each industry.

The reasons for the choice of these techniques are explained below.

1.2.1 Historical Analysis

The purpose of the historical analysis was to provide an informed perspective for each industry from which to view future trends. The historical analysis covers: the economic environment, competitive factors, output and employment patterns, productivity, technology adoption and the industrial relations environment. In order to permit cross-industry analysis, consistent indicators and data sources were used. The historical analysis summarized in

this summary report, however, focuses on two key indicators: an appropriate measure of aggregate output and employment levels in Ontario.

1.2.2 Expert Interviews

At various stages in the project, a series of in-depth interviews were conducted with industry leaders, industry associations and union representatives. These experts had a broad understanding of their respective industries in terms of both historical development and future outlook. Their input assisted in the preparation of the historical analysis and in the survey design, and facilitated a clearer interpretation of the survey results.

1.2.3 Sample Survey of Firms

The following describes the key features of the sample survey.

Ontario firms in the selected service industries were identified, using a variety of sources and techniques.

Appendix A provides a discussion of these and the sample frame for each of the service industries investigated.

A representative, random sample of firms, stratified by employment size categories (see Appendix B for categories), was chosen. The senior executive officer of each firm was identified and a structured questionnaire was sent to this individual.

A search was carried out of the Ontario Ministry of Labour Collective Agreements Library to identify unions in the sample firms. Union head offices were contacted to identify the appropriate union leader in each of the unionized firms in the sample. The same questionnaire was sent to union representatives. A copy of the survey questionnaire is attached to each of the individual industry reports.

Consultants provided ongoing assistance to respondents, both on the telephone and in person, to complete the questionnaires. The questionnaire survey process generally ended with a personal interview. The number of firms and unions who participated in the sample survey are shown in Table 1.

In most cases, several participants in each organization contributed to the completion of a questionnaire. For all service industries surveyed, an average of 2.2 participants contributed to a firm questionnaire and 1.6 participants to a union questionnaire. The companies' principal participants had an average of 13.5 years' experience with their firms. The unions' principal participants had an average of 13.7 years with their firms. Table 2 shows these characteristics of respondents, by industry.

The sample survey results have been weighted up to the number of firms in the sample frame. That is, the survey results reported herein refer to the weighted survey results and are, therefore, representative of the sample frame for each industry in Ontario. The reliability of the sample and the degree of error are noted in Table 1. See Appendix C for an explanation of the sample reliability calculation method.

n.a. - not applicable

Readers should, however, be cautioned about the nature and reliability of the sample survey results. The questionnaire included a set of questions asking respondents about the future (i.e., five and ten years ahead) from a particular time. The results are, therefore, a representative sample of views about and expectations for the future and should not be viewed as what will take place. The survey provides a useful perspective from which to better understand how the industries studied in the service sector view the future of new technology adoption and its anticipated impacts on employment.

Discussion of the Retail Food and General Merchandising industries is based on a series of expert interviews with key industry sources, not on a sample survey of the two industries. The reason for this treatment is the fact that during the survey (Fall of 1984 to Spring of 1985), these industries were in the midst of significant structural and organizational changes. Firms in these industries invited to participate declined almost universally due to internal priorities and lack of certainty about their futures.

The next chapter of the report discusses the historical output and employment of each industry from 1971 to 1983. Subsequent chapters review the results of the sample survey and expert consultation which discuss the anticipated trends for the period 1985 to 1995.

2.0 HISTORICAL ANALYSIS

This chapter of the report provides an overview of the historical performance from 1971 to the early 1980's of the selected service industries investigated. Two key indicators are used: an appropriate measure of industry output and employment levels in Ontario. These indicators have been selected as they illustrate the level of economic activity and the associated employment trends.

2.1 Aggregate Output

Table 3 shows the service industries, along with an output measure and annual compound rates of growth in constant (1971) dollars for this indicator during four periods of time: 1971 to 1976, 1976 to 1981, and, depending on data availability, 1981 to 1982 and 1982 to 1983. With the exception of Chartered Banks, Trust Companies and Telegraph and Cable Systems, the output measure is for Ontario. For these three industries, only data for Canada are available. As benchmarks for comparison, the table shows growth in the Ontario Gross Domestic Product (GDP) during each period reviewed and the Canada GDP for the total Service Sector (service-producing industries plus government). Comparable figures for the Ontario Service Sector are not available.

Most of the industries reflect the pattern of business cycles during the 1970's and early 1980's which may be briefly described as:

- strong growth in the early 1970's with a cyclical peak in 1974,
- a significant downturn in 1974-75, reflecting the economic recession which was largely driven by the shock of oil shortages and higher energy costs,
- a steady recovery from 1976 to 1979, and

TABLE 3: SUMMARY - SELECTED SERVICE INDUSTRIES:

* Includes bank mortgage loan subsidiaries

- the start of a severe and long recessionary period in 1980, lasting to 1983.

Exhibit 1, based on the data in Table 3, compares the output performance of the selected service industries during the four periods of time as either much greater than the Ontario Gross Domestic Product (GDP) (++), greater than GDP (+), about the same as GDP (o), less than GDP (-), or much lower than GDP (--).

Exhibit 2 provides a brief commentary on each industry's output performance during these periods. The following provides some additional comments by industry.

- The financial services industries, as a group, showed a strong performance from 1971 to 1981, with Chartered Banks being hit harder by the recession than Trusts Companies. The chief reason for this difference was that the Chartered Banks serve commercial clients whose businesses were in recession and under strong pressure to reduce debt outstanding while the Trust Companies serve individuals who actually increased savings enabling the Trust Companies to capture an increasing share of personal savings in this period. Life Insurance continued to lose its traditional share of personal savings during the decade, particularly to Banks, Trusts and to Savings Vehicles offered by the Federal Government (i.e., Canada Savings Bonds and Treasury Bills). General Insurance increased its premium income during the high inflation decade but, as an industry, it consistently lost money on its underwriting activity because competitive pressures held premiums below the level required to cover insurance claims.
- The expenditures of the three levels of government as a group remained just ahead of GDP throughout the 1971 to 1981 decade. Their apparent growth in the 1981 to 1982 recession

SELECTED SERVICE INDUSTRIES: OBSERVATIONS ON INDUSTRY

OUTPUT PERFORMANCE FROM 1971 TO 1983

<u>SIC</u>	<u>Industry</u>	<u>Comments</u>
701	Banks and Trusts Chartered Banks Trusts and Others	Banks showed good performance growth but lagged Trusts; affected by recession. Trusts showed a strong, steady performance of growth despite recession.
721	Insurance Carriers Life	Life Insurance outperformed GDP overall; led General Insurance 1976 to 1981.
735	General	General Insurance outperformed GDP overall; led Life Insurance 1971 to 1976.
909	Insurance and Real Estate Brokers and Agents excluding Real Estate sales	Insurance Commissions outperformed GDP; followed more closely the performance of General Insurance than Life.
931	Federal Administration	Expenditures were close to GDP; rising cost of unemployment and debt service increased outlays 1982.
951	Provincial Administration	Ontario Government restraint evident in 1976 to 1981; need to maintain services in 1981 to 1982.
544	Local Government	Close to GDP 1971 to 1981; need to maintain services in 1981 to 1982.
545	Telephone Systems	Strong steady performance largely related to regulation of rates by CRTC.
631	Telegraph and Cable Systems	Strong steady performance but downturn during 1982 recession.
	Retail Food	Below performance of GDP with slight recovery in recession due to changes in eating habits.
642	General Merchandise	Well below GDP growth from 1972 to 1982; modest recovery in 1982-83.
853	Computer Services	Strong steady growth building through the 1970's.
867	Offices of Management and Business Consultants	Revenues well below GDP 1973 to 1976 but significantly above GDP 1976 to 1981; real decline in growth during the recession, in 1982-83.

year, compared to a 5.5% drop in GDP, is largely reflected in the need for government to maintain and, in the case of some programs, increase payments such as unemployment insurance during recessionary periods. (The measure of output in this sector is the level of expenditure.)

- The Telecommunications industries showed strong growth throughout the decade with some dampening during the recession.
- The retail industries selected for investigation were weak throughout the decade with modest recovery of food sales during the recession as consumers shifted from eating out to eating at home. General Merchandising sales were weak primarily because of a loss of market share to other types of retailing vehicles.
- The Computer Services industry grew significantly and consistently faster than GDP over the 1970's and early 1980's, while the Business Consulting industry's fortunes fluctuated with the economic business cycles.

Exhibit 3 highlights key cyclical patterns and major environmental factors affecting each of the service industries over the period being reviewed. Further detail is provided in the specific industry reports.

2.2 Employment

In 1981, total employment in the selected service industries was approximately 680,000, representing 16% of all employment in Ontario and 58% of Ontario's employment in the Service Sector.¹

¹ The Service Sector includes Community and Business Services, Trade, Communications, Public Administration, Finance, Insurance and Real Estate.

SELECTED SERVICE INDUSTRIES: OVERVIEW OF ECONOMIC PERFORMANCE AND KEY ENVIRONMENTAL FACTORS

SIC	INDUSTRY	1971 to 1976	1976 to 1981	1981 to 1983
701	CHARTERED BANKS	Strong steady growth in assets throughout decade (7.4% per annum 1971-1980). Favourable growth factors in 1970's: buoyant economic growth (e.g., savings, consumer durables spending, construction, business financing) favourable legislation (more powers), limited competition with other financial institutions and increased scope of international operations. Bank mortgage loan subsidiaries increase their share of mortgage market, but banks lose share of personal savings to other institutions.		Dampened growth in 1981-1982; recovery 1982-1983.
	TRUST COMPANIES	Steady, rapid growth in assets throughout decade. Slowdown in new house construction leads to decline in mortgage loan growth. Favourable growth factors in 1970's: growth in housing market, in 1971-1978; related regulations in late 1970's. Further weakening of demand for mortgage loans. Trust and loan companies gather increased share of personal savings but lost mortgage loan share to bank mortgage subsidiaries. Increased cross-ownership of financial institutions. Major trust mergers take place.		Convergence between Trusts and Life Insurance product lines.
721	LIFE INSURANCE CARRIERS	About same as Ontario GDP. Mature industry: high rates of saturation. High level of competition with other institutions for personal savings (banks, trust companies, credit unions, Federal Government). Share of personal savings has declined from 13.7% in 1976 to 11.9% in 1983. Share of assets has declined from 21.4% in 1971 to 14.5% in 1983. Growth in premiums (deflated by GNP Implicit Price Index)	Higher than GDP. New product offerings (e.g., annuities, RRSP, variable rates). Increased cross-ownership of financial institutions - convergence of product lines. About same as GDP. Underwriting losses 8 out of 10 years from 1973 to 1982. Implicit Price	Weak economic growth. Slower rates of inflation. Increased popularity of self insurance. Some business failures and corporate consolidations.
735	INSURANCE BROKERS AND AGENTS	Ontario premiums (deflated by GNP Implicit Price Index) increase much faster than GPP in 1971-1976, less so in 1976-1981. Commission rates have declined from 25% in 1960's to 14-15% in 1970's to 13.6% in 1981-1982. Few large firms serve large commercial clients. Large number of small firms.		
901	FEDERAL PUBLIC ADMINISTRATION	Federal expenditures increased share of GNP from 13.4% in 1971 to 19.6% in 1982. Expenditures rose rapidly 1971-1975. Driving factors: enrichment of social programs, higher unemployment rates, economic development measures, equalization payments, carrying costs of public debt.		Rose again sharply 1980-1981. High growth driven by unemployment, high debt, and need to maintain services.
931	PROVINCIAL PUBLIC ADMINISTRATION	Expenditures rose rapidly 1971-1975 Restraint More rapid population growth and strong revenue growth are factors.	Restraint Introduced due to need to address rising debt load of Province. Population growth levels off; revenue growth stable.	Expenditures lead GDP due to need to maintain services. Suppressed revenue increases and provincial debt inhibit spending.
951	LOCAL PUBLIC ADMINISTRATION	Moderately high growth 1971-1977 High population growth, urbanization and household formation drive local government expenditure growth.	Little real growth 1977-1979 due to price/wage controls Reduced transfer payments and consumer squeeze, lower population and economic growth dampen spending growth.	Moderate increase in spending 1980-1983. Need to maintain services.

EXHIBIT 3 (CONTINUED)

SIC	INDUSTRY	1971 to 1976	1976 to 1981	1981 to 1983
544	TELEPHONE SYSTEMS AND INTERCONNECTS	Moderately high growth in revenues throughout decade with one exception; decline 1977-1978. Main driving factors - rising number of telephones per household, economic and business expansion, high rates of household formation, increased long distance use and protected revenue base due to regulation of rates. Industry highly regulated.	Increased competition due to moderate deregulation. 1979-buy own equipment 1981-intercity services 1982-interconnect terminals 1984-cellular radio network 1984-"light handed" regulation of selected services Deregulation has brought about a new telephone interconnect industry competing to install business telephone systems. Rapid growth for this segment.	
545	TELECOMMUNICATIONS CARRIERS	Strong real growth in revenues 1971-1974. Modest growth 1974-1978. Strong 1978-1979. Modest growth 1979-1981. Main driving factors - telecommunications advances, economic and business expansion, increased services, greater needs of business to communicate effectively. Industry highly regulated.		Decline 1981-1982, due to recession. "Lighter" regulation.
631	RETAIL FOOD	Modest sales increase 1972-1976 (below GDP). Major driving factors - population growth, consumer purchasing power, aging population (fewer calories), life styles (e.g., more specialty foods) inflation (e.g., reallocation of food budget) Factors all positive 1972-1976. Mature, competitive industry.	Decline in sales 1976-1981 (below GDP). This segment generally slow to respond to changes. Adaptors do well; slow respondents have suffered. Junior department stores have outperformed seniors. General merchandisers have lost to specialty retailers.	Increase in food sales. 'No name' products.
642	GENERAL MERCHANDISE	Modest increase. Major driving factors - growth and age of population, personal incomes, competition with other retail segments. Population and purchasing power favourable. 1971-1976.	Factors negative 1976-1981. Reduced margins. New store formats. Increased competition. All factors negative 1976-1981. New store formats. 'No frill' services. This segment generally slow to respond to changes. Adaptors do well; slow respondents have suffered. Junior department stores have outperformed seniors. General merchandisers have lost to specialty retailers.	Factors continue to be negative. Increased specialization.
853	COMPUTER SERVICES	Sharp increase in revenues 1973-1974; subdued 1974-1976. Strong growth 1976-1978. Subdued 1978-1979. EDP equipment rental/lease/sales. Emphasis on rental/lease. Hardware, firmware drive selection. Computer services- Service bureau cost advantage over in-house for many uses.	Subdued 1978-1979. Emphasis from rental to sale. Market emphasis on application, processing and customization. Availability of software drives selection. In-house computer now more cost-efficient. Strong steady growth 1979-1981.	Sharp, steady growth 1979-1982. Reduced costs of information technology and software development are main driving factors. Shrinkage in rental/lease segment. Success dependent on finding market niche.
867	OFFICES OF MANAGEMENT AND BUSINESS CONSULTANTS	Management consultants. Decline 1973-1975. Revenues fluctuate with business cycles. Diverse group of specialist business consultants. Limited information available.	Stable 1975-1977. Rise sharply 1977-1978. Decline 1978-1979. Strong steady growth 1979-1981.	Stable 1981-1982. Decline 1982-1983. Increased number of very small firms (under 5 employees). Increasing specialization in services/industry knowledge. Some mergers of larger firms.

The 1981 employment level of the selected service industries, as a group, increased by approximately 43% over the 1971 employment level of approximately 445,000, creating some 193,000 new jobs during the decade. This compares favourably to a 31% rate of increase in total Ontario employment during the decade, but is lower than the employment growth for Ontario's total Service Sector (55%) during this period.

Table 4 presents:

- the 1981 Ontario employment levels of the selected service industries,
- each industry's share of total Ontario employment in 1971 and 1981,
- the number of jobs each industry generated between 1971 and 1981, and
- the average annual compound rates of change in employment growth over the 1971 to 1981 decade.

Also provided as benchmarks for comparison are the average annual compound rates of change over the 1971 to 1981 period for total Ontario employment and for total employment in the Ontario Service Sector.

Based on the employment data in Table 4, Exhibit 4 rates the job creation performance of the selected service industries relative to employment growth in Ontario's total service sector as significantly above average (++), above average (+), about average (o) or below average (-).

Also provided as reference points are the actual jobs created over the decade, thereby suggesting the magnitude of employment growth in each industry.

TABLE 4: SUMMARY - SELECTED SERVICE INDUSTRIES

EMPLOYMENT IN ONTARIO						
SIC	Industry	Jobs Created 1971-1981 ⁽¹⁾	Share of Total Ontario Employment		Average Annual Compound Rate of Change 1971-1981	Number of ⁽¹⁾ Employees 1981

867	Business Consultants	++	<u>7,600</u>
Total			193,000

++ Significantly above average
+ Above average
o About average
- Below average

(1) 1972 to 1981

- Banks and Trusts created about 43,900 jobs during the decade or about 23% of the selected Service Industries combined.
- The three levels of government created about 56,100 jobs during the decade or about 29% of the total for the selected Service Industries.
- Although Computer Services and Business Consultants had the fastest job creation rates, they accounted for only about 11% of the jobs created by the selected Service Industries.
- Insurance carriers, agents and brokers also accounted for about 11% of the total jobs created in the selected industries during the decade.
- The two retailing industries - Retail Food and General Merchandise, generated 36,700 jobs in the period 1972 to 1981, or about 19% of the total.
- The Telecommunications industries accounted for roughly 8% of the total.

In terms of employment growth rate, four industries were strong performers relative to the average growth rate for the total Ontario Service Sector.

- Banks and Trusts,
- Telephone Systems,
- Computer Services, and
- Business Consultants.

The remaining industries grew at a slower rate than the total for the Ontario Service Sector.

2.3 Conclusion

Using the results from Tables 3 and 4, Exhibit 5 compares each of the selected service industry's growth in output, relative to Ontario GDP growth (in constant dollars), and growth in employment, relative to total Ontario employment growth. The purpose of this exhibit is to compare growth in industry activity to growth in employment. That is, does employment growth lag or lead output growth? A few cautionary notes are worth making.

1. The output measure used for each industry is only one indicator of industry activity. The specific industry reports provide several different measures for each industry's historical analysis, and provide a more comprehensive view than the summary report's more narrowly defined output measure.
2. The employment figures are for total employment. They do not distinguish between full-time and part-time or casual employment. For some key service industries, such as Banks, Trusts, and Retailing, there has been a trend toward increased use of part-time employees.

With these notes in mind, Exhibit 5 suggests that, in general, most of the selected services' employment growth rates are comparable to their growth rates in output over the decade. The few apparent exceptions are:

- Bank employment outpaced asset growth, but this may be explained by the increased use of part-time employment over the decade and the limitations of using assets as a measure of total banking activity.
- Life insurance employment growth lagged premium gains. New technology adoption and increased productivity are probable explanations.

EXHIBIT 5

n.a. = not applicable.

* The data on this industry are incomplete and may explain the significant difference in below average revenue and strong growth in employment.

- Employment in Federal and Provincial Public Administration lagged expenditure growth and may be explained by the fact that a large share of these expenditures is for transfer payments and debt servicing, and not direct service delivery by Federal employees.
- Employment growth in Telegraph and Cable Systems (Telecommunications Carriers) was essentially static compared to rapid growth in revenues. This may be explained by productivity gains due to new equipment.
- Retail Food employment increased at a moderate rate while sales in constant dollars have declined. This may be explained by the increased use of part-time workers and the highly competitive nature of the industry.
- The output measure for Business Consulting shows below average growth while employment expanded significantly. This anomaly may be explained by the poor quality of data available for this industry in terms of measuring output. This issue is discussed further in the Historical Analysis Chapter (2.0) in the industry report on Computer Services and Business Consulting (Appendix 18 of the Task Force final report).

The next chapters summarize the industry survey results for the selected Service Industries.

(1) 'o' used prior to 1985 to indicate have not adopted. '-' used for period 1985-1990 and 1990-1995 to indicate respondents, at the time of survey are not planning to adopt this technology or 'don't know'. Responses are NOT mutually exclusive.

* common to all service industry questionnaires

3.0 ADOPTION OF NEW TECHNOLOGY

This chapter reports the expected trends in the adoption of new technologies in the selected service industries and the factors driving the need for and affecting the rate of technology adoption. The discussion is based on the survey results and the expert consultation process.

3.1 New Technologies and Rates of Adoption

Table 5 summarizes, for all the selected service industries as a group, the percentage of firms which have adopted various new technologies before 1985, or will by 1990, or will after 1990 and before 1995. Firms may have chosen more than one time period per technology. Generally, however, only one time period was selected. The sample of firms in each industry had a customized list of technologies to which they responded. A group of technologies was common to all service industries. These are noted on Table 5 with an asterisk (*).

Exhibit 6, based on the survey data in Table 5, categorizes the common service technologies by timing as 'already here', 'near-term', or a 'mid-term' technology.

Table 6 presents the results of the survey for the finance and insurance industries on the technologies they have already adopted or plan to adopt between 1985 to 1990 or 1990 to 1995. Table 7 presents the same for the three levels of government: Federal, Provincial, and Local. Table 8 presents the survey results for the Telecommunications, Computer Services and Business Consulting industries.

Telecommunications	<ul style="list-style-type: none"> - Computerized Service Order Processing - Computerized Client Accounts - Remote Maintenance - Customized Telecommunications Systems - PABXs - Electronic Mail - Satellite Microwave Systems - Fibre Optics - FAX with Built in Microprocessors 	<ul style="list-style-type: none"> - Voice Synthesis Applications - Voice Recognition Applications - Voice Mail
Retail Food and General Merchandise	<ul style="list-style-type: none"> - Electronic Cash Registers - Point of Sales Scanners - Optical Scanners - Computerized Inventory Control - Computerized Ordering Systems 	<ul style="list-style-type: none"> - Credit Card Verification - T.V. Shopping - Computerized Sales Aids - Automated Warehousing - Automated Transfers and Set-up - Automatic Teller Machines (ATM) - Electronic Funds Transfer
Computer Services and Business Consultants	<ul style="list-style-type: none"> - Installed Customized Software Systems - Installed Customized Hardware Systems - On-line Client Access to Data Bases - On-line Interactive Systems with Clients 4th Generation Computer Languages - Video Conferencing - Electronic Filing 	<ul style="list-style-type: none"> - Integrated Work Status - Home Terminals

Exhibit 7 identifies specialized technologies and applications by service industry clusters by time-period, i.e., 'already here' to 'mid-term' or 'mid-term' to 'near-term'.

It is difficult to categorize industries as technology 'leaders', 'followers' or 'laggers' because of the diversity of applications and different nature of each industry's business. The following are, however, some comments on apparent patterns of technology adoption within service industry clusters, based on the firms surveyed.

- Banks lead Trusts in the use of electronic funds transfer (EFT) and automatic debit/credit systems. Trusts, however, appear to be more open to adopting, or more advanced in their planning, for such technologies as "smart cards" and computerized loan qualification and approval. Both industries appear advanced in their use of and plans for office automation technologies. Banks lead Trusts in the use of various telecommunication technologies.
- Overall, there are few apparent differences between Life and General Insurance Carriers in their use of and plans for new technologies. Insurance Brokers generally follow the Carriers in technology adoptions.

(1) Weighted Importance = (First * x 3) + (Second * x 2) + (Third * x 1)

- Federal and Provincial Governments appear close in their use of and plans for new technologies. Local Governments are followers.
- Telephone Systems and the Telecommunications Carriers are leaders in technology adoption, with municipal phone systems and interconnects generally as followers.
- The Computer Services industry appears ahead of the Business Consulting industry in its use of and plans for new technology adoption.

In general, larger organizations appear to be technology leaders in their respective industries.

3.2 Forces Driving the Need to Adopt New Technology

Firms in the service industries studied were asked in a series of open-ended questions to identify the three most important factors driving their need to adopt new technology. Table 9 summarizes the results of the survey. It shows the percentage of firms which named a factor as their most important, second most important and third most important. Table 9 also shows the weighted importance of each factor which is derived by the following formula:

$$\text{Weighted Importance} = (\text{Most Important \%} \times 3) + (\text{Second \%} \times 2) + (\text{Third \%} \times 1)$$

Thus, the most important factors named were given a weighting of three (3); the second most important factors named were given a weighting of two (2); and the third factor named was weighted by one (1). The weighted responses for a factor were then totalled to calculate the weighted importance factor.

EXHIBIT 8
DRIVING FACTORS RATED BY IMPORTANCE

<u>SIC</u>	<u>Industry</u>	<u>First</u>	<u>Second</u>	<u>Third</u>
701	Chartered Banks	Competition	Information	Profit
701	Trust Companies	Cost	Competition	Skills
721	Life Insurance	Competition	Customers	Productivity/ New Markets
721	General Insurance	Competition	Productivity	Customers
735	Insurance Brokers	Competition	Productivity	Customers
909	Federal Administration	Productivity	Skills	Cost
931	Provincial Administration	Productivity	Customers	Cost/ Skills
951	Local Government	Productivity	Cost	Information
544	Telephone Systems	Skills/ Quality	Information	Cost/ New Markets
545	Telecommunications	Productivity	Skills	Customers/ New Markets
631	Retail Food (1)] Cost	Competition	Productivity
642	General Merchandise(1)			
853	Computer Services	Customers/ Cost	New Markets	Obsolescence
867	Business Consultants	Competition	Cost	Information

(1) Based on expert interviews.

A relatively narrow range of forces is driving firms to adopt new technologies. Overall, the organizations in the service industries studied indicate that the critical driving factors are:

	<u>Overall Weighted Importance</u> ⁽¹⁾
● Increased productivity	1.0
● Competitive pressures	0.8
● Lower costs	0.8
● Customer demands for changes	0.7
● Increased organizational skills	0.6
● Increased management information	0.5

(1) Excludes retailing service industries.

The driving factors did vary, by industry, in terms of the motivational focus for technology adoption, as indicated by the overview in Exhibit 8, which summarizes the survey data presented in Table 9.

Exhibit 8 shows that competitive pressures and customer demands for change are the main driving factors in the private sector service industries, while increased productivity is the main driving factor in the public sector. Increased productivity, lower costs and increased profits represent a strong secondary set of factors in the service sector as a whole. Obsolescence of existing equipment and machinery was not a prominent contributing factor.

(1) Wt-weighted Importance = (First % x 3) + (Second % x 2) + (Third % x 1)

3.3 Factors Which Could Slow the Rate of Technology Adoption

Firms were also asked to name the three most important factors which could slow the rate of technology adoption. Table 10 summarizes the percentage of firms in each industry which identified each factor as first, second or third in importance. Again, the weighted importance of each factor is shown.

Similarly, a limited number of factors were identified which could slow the rate of technology adoption. Overall, for the firms in the service industries surveyed, the critical factors which could slow their rate of technology adoption are:

	<u>Overall Weighted Importance</u> (1)
● Ability to finance/profitability	1.3
● Cost of new technology	1.0
● Lack of skills to implement	1.0
● Unwillingness to change	0.5
● Poor economic conditions	0.4

(1) Excludes retailing service industries.

Again, the critical factors cited which could potentially slow the rate of technology adoption varied by industry. (Exhibit 9).

The most prominent theme is the two-edged factor: the ability to finance the technology and the cost of the technology. Overall economic health is a secondary theme.

EXHIBIT 9
SLOWING FACTORS RATED BY IMPORTANCE

<u>SIC</u>	<u>Industry</u>	<u>First</u>	<u>Second</u>	<u>Third</u>
701	Chartered Banks	Cost	Economy Skills	Government Aid
701	Trust Companies	Skills	Finance	Cost
721	Life Insurance	Cost	Skills	Unwilling
721	General Insurance	Cost	Skills	Finance
735	Insurance Brokers	Cost	Finance	Economy
909	Federal Administration	Finance	Skills	Standardization
931	Provincial Administration	Finance	Skills	Unwilling
951	Local Government	Finance	Unwilling	Skills
544	Telephone Systems	Cost	Finance Economy	Skills Standardization
545	Telecommunications	Economy, Regulation	Finance	Standardization
631	Retail Food(1)	Cost Finance	Skills	Standardization
642	General Merchandise(1)			
853	Computer Services	Finance Skills Cost	Economy	Compete Unwilling
867	Business Consultants	Finance	Cost	Economy Unwillingness

(1) Based on expert interviews.

Lack of skills to implement and unwillingness of the organization (i.e., senior managers or decision makers) to change are a strong secondary theme running through the service industries.

Lack of government assistance is another secondary factor cited by a couple of industries: Banks and Computer Services, as was lack of technology standardization: Federal Government, Telephone Systems and Telecommunications.

The survey clearly demonstrates that service industries do not perceive employee acceptance or union resistance to new technology as factors which will slow their rate of technology adoption.

3.4 Conclusion

Many firms in the selected service industries either have already or plan to adopt many of the new technologies in the near term (i.e., before 1990). The most important factors driving firms to adopt these new technologies are competitive pressures, demands of customers and the need to lower costs, increase productivity and improve product quality. The most significant factors that could slow the rate of technology adoption are poor economic conditions, the firm's level of profitability and the cost of technology.

4.0 INDUSTRY OUTLOOK TO 1995

This chapter presents the survey results and the views of the experts on the anticipated outlook for the selected service industries in Ontario in terms of aggregate output, investment plans, aggregate employment and changes in occupational structure to 1995.

4.1 Output to 1995

Organizations in the service industries were asked to estimate industry-wide growth, using an appropriate indicator of output in constant dollars. The survey results, by industry, are shown in Table 11. Also provided, as benchmarks for comparison, are actual compound growth rates in output for each industry, from 1971 to 1981, in constant dollars.

The estimates for future growth should be tempered somewhat. That is, although respondents were asked to estimate output in constant dollars⁽¹⁾, some of the survey results for a selected service industry suggest the possibility that some respondents may have expressed their answers in current dollar terms. For example, the Provincial Government expert level respondents believed that current dollar Provincial expenditures would generally just keep pace with inflation during the next ten years. This suggests a zero percent real growth rate whereas the survey respondents in this industry are expecting a 3.5% real growth rate over the next ten years.

¹ There were three exceptions: Life Insurance, General Insurance and Insurance Brokers were asked to estimate future output in current dollars. Their estimates in Table 11 have been adjusted to constant dollars using the following estimates of inflation: 4.0% from 1985 to 1995. These estimates of inflation are supplied by Currie, Coopers & Lybrand's Economics Practice.

EXHIBIT 10

COMPARATIVE RATING OF INDUSTRY-WIDE OUTPUT

PERFORMANCE AND OUTLOOK

<u>Industry</u>	Recovery from Recession <u>1982 to 1985</u>	Outlook Relative to 1971 to 1981 Performance	
		<u>1985 to 1990</u>	<u>1990 to 1995</u>

++ Growth during recession only dampened; very strong post-recession recovery

+ Strong recovery

o Modest recovery

- Weak recovery

n.a. not applicable

++ Retail Food: Growth accelerated from 1981 to 1983; flat performance since 1983.

+ Strong outlook
o Modest outlook
- Weak outlook

Based on the data in Table 11, Exhibit 10, categorizes each industry's performance from 1982 to 1985 as 'weak' (-), 'modest' (o), or 'strong' (+) recovery relative to the 1981 to 1983 recession. For a few industries, the recession only dampened their growth and they have demonstrated very strong (++) recovery in recent years. The Government sector is not rated as, by necessity, it has to maintain services and does not generally contract during business cycles. Exhibit 10 also categorizes the 1985 to 1990 and 1990 to 1995 outlooks for each as weak (-), moderate (o), or strong (+), relative to each industry's respective performance over the decade 1971 to 1981.

Overall, the exhibit suggests that most service organizations were not as severely affected by the recession as the manufacturing sector. However, most do expect slower growth over the next ten years than that experienced during the 1971 to 1981 decade. The only exceptions are the Federal Government, Telephone Systems, Computer Services and Business Consulting industries which are expecting growth throughout the near and mid-term periods above their respective 1971 to 1981 rates of growth.

However, the growth outlook for three of these industries - Federal Government, Telephone Systems and Business Consulting - is not clear. It appears that some respondents in these industries may have had difficulty in articulating their expectations for their industry in terms of real growth (i.e., constant dollars). This implies that their growth expectations could be discounted by up to, say, 4% per annum over the next ten years.⁽¹⁾ Thus, the only industry expected to clearly grow, in real terms, faster than it did in the 1971 to 1981 period, is the Computer Service industry, even if its forecasts are adjusted for inflation.

¹ Consumer Expenditures, Services, Implicit Price Deflator forecast: 1985 to 1995 - 4.0% per annum. Forecasts by Economics Practice, Currie, Coopers & Lybrand.

4.2 Investment Patterns

Firms were asked about their future capital investment plans over the period 1985 to 1990 and 1990 to 1995. The survey results are shown in Table 12.

In general, firms' responses were incomplete for the mid-term period, that is, they are less certain of their capital spending plans in the period 1990 to 1995.

The table shows that the largest portion of the service industries' capital investment goes toward machinery and equipment as compared to structures and buildings. One prominent exception to this pattern is Local Government which spends approximately 90% of its capital program on structures, buildings and other hard services (e.g., roads, sewers, watermains). Firms in a couple of industries appear to be planning relatively major building programs in the near future, namely: Life and General Insurance and Insurance Brokers. The Telephone Systems have on-going structure and building requirements to maintain and expand their systems in serving the public.

A relatively small share of firms' "bricks and mortar" planned capital spending is related to new technology. Exceptions are the Telephone and Telegraph and Cable Industries, which plan capital expenditures related to expansion and upgrading of their telecommunications systems.

In contrast, a high percentage, on average two-thirds, of the service industries' capital investment in machinery and equipment is expected to be related to new technology. Local Government is again a notable exception. Only about a quarter of municipalities' machinery and equipment capital budgets are related to new technology. This may be explained by the nature

of Local Government. A significant part of their machinery and equipment expenditures are related to rolling stock (e.g., buses, trucks, cruisers) and related equipment for the maintenance and expansion of public works (e.g., roads). Excluding Local Government, most of the service industries will be spending over two-thirds of their machinery and equipment capital budgets on new technologies.

4.2.1 Justifying Financial Investment in New Technology

Firms in each industry were asked how they evaluate and justify financially investments in new technology. The results of their responses are shown in Table 13.

The most commonly used measure is the expected pay-back period of the investment, which was used by over 50% of the service industry organizations. The pay-back period ranged from two and a half ($2\frac{1}{2}$) to four and a half ($4\frac{1}{2}$) years. Insurance Brokers had the longest pay-back period - $4\frac{1}{2}$ years; Life Insurance and Business Consulting the shortest - $2\frac{1}{2}$ years. The average pay-back period for the firms sampled was three and a half ($3\frac{1}{2}$) years.

Return on investment (ROI) is used by about 30% of the service organizations for evaluating investment decisions. ROI expectations ranged from 13% to 25%. The average expectation is about 18% ROI which is comparable to an average four year, pay-back period. Telephone Interconnects, Computer Service and Business Consulting firms had the highest ROI expectations.

As is evident from the table, many firms use more than one test for evaluating capital investment decisions in new technology. Firms surveyed were asked if they used any considerations or mechanisms other than pay-back or ROI to evaluate such investments. Approximately 16% of the

organizations identified 'strategic' considerations in evaluating decisions on adopting new technologies.

4.2.2 Source of New Capital Spending

Firms in each industry were asked how they will finance their capital programs; from either internal or external sources. The results, by industry, are presented in Table 14.

Approximately 85% of all capital funds for the selected service industries are expected to be generated internally (i.e., from cash flow).

4.3 Employment to 1995

This section reviews the expected trends in employment patterns and the most important factors that will influence employment of firms.

4.3.1 Factors Affecting Employment

Organizations in each industry were asked, in a series of open-ended questions, to identify the most important factors that would affect their organizations' future employment levels in Ontario. The detailed results are shown in Table 15. The same weighted importance procedure, as described above was used to help analyze the survey results.

(1) Weighted Importance = (First % x 3) + (Second % x 2) + (Third % x 1)

Overall, for the reporting firms, the most important factors are:

	<u>Overall Weighted Importance⁽¹⁾</u>
● Economic Growth	0.9
● Introduction of New Technologies	0.8
● Industry-Wide Growth	0.7
● Increased Market Share	0.6

(1) Excludes retailing service industries.

Overall, for the service industries, 'economic growth' is perceived as the most important factor influencing the future employment level of the service sector organizations surveyed. It is followed in importance by the introduction of new technologies, industry-wide growth and increases in market share as dominant themes influencing the level of employment over the next ten years.

Exhibit 11 shows variations in employment factors, by industry. All three levels of government identified public policy as the most significant factor that would affect their future employment levels. Technology is the key factor in four of eleven private sector service industries investigated, and a secondary or tertiary factor in four of the remaining seven industries.

In the retail trade sector, market share is rated as the most important factor affecting employment. Industry executives see market share as a driving force behind the rate of store expansion and thus employment levels in the industry. In the retail food store industry, which is more highly unionized than the general merchandise store industry, collective agreements dealing with manning issues are also rated as an important factor affecting employment levels. In both segments of the retail trade sector, government legislation that could change the

EXHIBIT 11

867	Business Consultants	Economic growth	Compete	Industry growth

attractiveness of part-time employees is perceived as an important factor which could alter the mix and level of employment in this sector over the next ten years.

As indicated elsewhere in this report, firms require new technology to survive and keep up with their competition. Competition is viewed as almost entirely domestic with virtually no foreign elements, as reflected in the survey results. However, the degree of competition will be greatly influenced by overall economic and industry-wide growth, as indicated by the survey results.

4.3.2 Aggregate Firm Employment Outlook

Firms in each industry were asked to estimate their employment in Ontario in 1981, 1984 and indicate their expectations for firm employment growth in Ontario in 1985, 1990, and 1995. The results are shown in Table 16 in terms of average annual compound rates of growth for each period, by industry. As a benchmark for comparison, the table shows the actual 1981 employment levels in each industry and the actual annual compound rate of change in employment from 1971 to 1981.

A comparison of future employment expectations over the period 1985 to 1995 shows that no service industry expects to create jobs at the same rate as it did in the decade 1971 to 1981. Two industries, Banks and the Federal Government, foresee essentially no employment growth. The Provincial Government and Telephone Systems expect a decline during the 1985 to 1995 decade.

n.a. - not available

Every industry foresees a lower growth rate in the mid term (1990 to 1995) as compared to the near term (1985 to 1990). Only a few industries expect growth rates in the near term comparable to those during the 1971 to 1981 period. These industries are:

	<u>Average Annual Compound Rate of Change</u>	
	<u>1971 to 1981 Actual</u>	<u>1985 to 1990 Expected</u>
Insurance Brokers	3.2	2.5
Computer Services	23.2	21.5
Food Stores	2.9	2.0

4.3.3 Trends in Part-Time Work

Increased use of part-time employment is a trend in many service industries. Results of the survey suggest continued increases in the use of part-time workers in the future for most of the selected service industries. The retail trade industries are expecting a continuing high proportion of part-time employees (i.e., 50+% to 60%). The survey results are shown in Table 17.

During the 1981 to 1985 period, most service industries indicated an increase in part-time employment with the exceptions of General Insurance and the Federal Government which experienced declines and Telephone Systems and Interconnects and General Merchandise Stores for which no data are available.

From 1985 to 1995, there is a continued but modest increase in part-time employment expected in the Service Industries. The survey results show the following sectors:

- Trust Companies,

TABLE 17: SUMMARY - SELECTED SERVICE INDUSTRIES

n.a. - not available

- Local Government,
- Life Insurance, and
- Insurance Brokers.

A decline in part-time employees over the 1985-1995 decade is expected to occur in:

- Computer Services.

4.4 Changes in Occupational Structure

Firms were also asked about expected changes in the occupational structure of their firm's work force over the next ten years. The results of these questions are reported in Table 18.

The results of Table 18 are summarized in Exhibit 12 which shows the overall direction for occupations in each major category during the period 1981 to 1995. That is, whether the occupation's proportion of the total work force is expected to increase significantly (++), increase (+), decrease significantly (--), or remain about the same (o). The summary for Banks is based on the expert interview results, not the survey results shown in Table 18.

Exhibit 12 suggests a fairly consistent pattern across almost all of the service industries.

- An increasing share in most of the Service Industries' work force in the Managerial, Administrative and Related occupations. Only two industries show a relative decline: Provincial Government and Computer Services.
- An increasing share in most of the Service Industries in the Natural Science, Engineering and Mathematics occupations.

		1990	20	15	27	4	35	100%

Several industries show relatively dramatic increases in this major occupational group: Trust Companies, Life Insurance, and Computer Services. The demand in most of these cases appears to be driven by the computer-related requirements of organizations in their respective industries.

- Firms in most service industries surveyed showed a decline in their organizations' proportion of total employment in Clerical occupations. The sharpest shifts are in Banks, Trusts, Life Insurance, Computer Services and Business Consultants. For most of these industries, a significant change has already taken place from 1981 to 1985. For example, Clerical occupations in Trusts went from 71% of the total employment in 1981 to 66% in 1984-1985. Insurance Brokers reduced Clerical occupations from 51% in 1981 to 48% in 1985. Firms in the Telecommunications Carriers industry reduced their Clerical share from 31% in 1981 to 27% in 1984, but no further change is expected.
- The importance of Sales occupations in the service industries is evident from Exhibit 12, as five of seven industries in which the occupation was named indicate that an increasing share of the work force will be in Sales occupations. General Insurance companies and Retailing industries report a relatively constant proportion of their work forces is expected to remain in Sales occupations.

When reviewing Table 18 and Exhibit 12, it should be kept in mind that a reduction in the percentage of the total work force in an industry does not necessarily translate into a loss of jobs in the occupational category because of the growth in the number of total employees over time. Furthermore, there may be changes in specific occupations within the broad occupational categories shown in Table 18. Discussions on expected changes in specific occupations in the major categories discussed here are contained in each of the industry reports.

5.0 EMPLOYMENT EFFECTS OF NEW TECHNOLOGY

This chapter reviews the survey results on the employment effects of new technology in terms of skills match, skill requirements, and impact on skill levels and job content.

5.1 Effects on Occupations

Table 19 summarizes firms' expectations of technology impacts on occupational requirements, by industry. Firms in each industry were asked to identify potential skill shortages (-) or oversupply situations (+) in specific occupations due to technological change. The occupations selected for each industry were chosen, based on an analysis of occupational changes in each industry for the period 1971 to 1981. Where there was a significant proportion of the work force in a specific occupation or an unusual shift in the proportion of the total industry work force during the 1971 to 1981 period, the occupation was selected for the survey.

As a further step, to help the reader, Table 20 lists the selected occupations, by industry, in which 35% or more of the firms surveyed anticipate an oversupply of skills due to the adoption of new technology. Table 21 does the same for the occupations in which a shortage of skills is anticipated.

Occupations shown in capitals (e.g., MANAGERIAL) in Tables 20 and 21 are defined as major occupational groups, while occupations in upper and lower case type (e.g., Systems Analyst) in Tables 20 and 21 are minor occupational groups, as defined by the 1971 Canadian Classification and Dictionary of Occupations.

n.a. - not available.

Tables 20 and 21 show many more skill shortages are expected than oversupply situations.

For some occupations, firms in one industry may expect an oversupply while, in another industry, a shortage may be expected for the same occupation.

In the cases of a few occupations, some firms expect an oversupply while others, in the same industry, expect a shortage. In these cases, there is obviously no consensus on the technology impacts on this occupation even within the same industry.

Overall, for the selected Service Industries, a skills surplus is anticipated in the Clerical occupations. Similarly, shortages in the Managerial and Systems Analysts occupations are anticipated. These patterns are shown more clearly in Exhibit 13, which presents a further consolidation, by industry, of frequently identified occupations in which 35% or more of the firms anticipated a change in skills in their organizations.

The most commonly identified occupations were:

- Managerial, Administrative and Related,
- Systems Analysts, and
- Clerical (with no significant change expected in Claims Adjustors, Telephone Operators, and Receptionists and Information Clerks).

EXHIBIT 13

FREQUENTLY IDENTIFIED OCCUPATIONS IN TABLE 19

(35% OR MORE OF ORGANIZATIONS IDENTIFY)

<u>Industry</u>	<u>SHORTAGE</u>		<u>SURPLUS</u>
	<u>Managerial</u>	<u>Systems Analysts</u>	<u>Clerical⁽¹⁾</u>
Chartered Banks	x	x	x
Trust Companies	x	x	x
Life Insurance	x		x
General Insurance	x	x	x
Insurance Brokers		x	x

Business Consultants	Attrition	Shorter hours	Retrain

n.a. Not available or no other answers provided.

5.2 Likely Steps to Deal With Skills Oversupply

In dealing with a potential oversupply of skills in their organizations, the most commonly cited action, across the service industries surveyed, was attrition. The second most frequent response was retraining. The third most common response varied in frequency among job sharing, lay-offs and lateral transfer. All other measures were less frequently mentioned. Table 22 deals with the most likely steps for each industry.

5.3 Likely Steps to Cope With Skill Shortages

In coping with anticipated skill shortages in their organizations, the most commonly cited steps named by firms in the service industries surveyed were, in descending order:

- retraining,
- recruitment, and
- upgrading.

Table 23, over, summarizes the survey results for each industry. The industries showed little variation from these actions.

5.4 Technology Impact on Skill Levels and Job Content

Respondents were asked to rank the impact of new technologies on selected occupations in terms of:

- skills required,
- time to achieve proficiency, and
- knowledge of firms' operations.

TABLE 23

SUMMARY - SELECTED SERVICE INDUSTRIES

MOST LIKELY STEPS ORGANIZATIONS WILL TAKE TO DEAL WITH SHORTAGE OF SKILLS

<u>Industry</u>	<u>Most Commonly</u>	<u>Second Most</u>	<u>Third Most</u>
Chartered Banks	Retrain	Recruit	Upgrade

Business Consultants	Retrain	Recruit	Upgrade

n.a. Not available or no other answers provided.

The results are summarized in Table 24. Firms were asked to indicate the impact of technology in terms of increase (+), decrease (-) or remain the same (o).

Table 25 suggests a high degree of consensus that technology will increase the skill level requirements of almost all the selected occupations. The following notes the occupations in which there is a clear consensus across the service industries that technology adoption will require an increase in skills. There were no occupations indicating a consensus on a decrease in skills in relation to new technology adoption.

Occupations In Which Firms Indicate a Clear Consensus
That Skills Will Increase
(i.e., 50% or More of the Firms Indicate an Increase)

- Managerial, Administrative and Related
- Natural Sciences, Engineering and Mathematics⁽¹⁾
- Clerical⁽²⁾
- Sales

The pattern of responses to the question about the impact of technology on the time to achieve proficiency were not as clear. The Managerial, Administrative and Related occupations as well as the Sales occupations were expected to require more time to achieve proficiency. The Clerical and Natural Sciences, Engineering and Mathematics occupations had responses which indicated no change or some increase in the time required. The major exceptions to this general pattern were for Receptionists and Information Clerks, Draughtsmen, and Banking and Finance

- (1) Only 25 percent of those firms with other engineers expected an increase in skill levels.
- (2) Banking and Finance Clerks, and Reception and Information Clerks had responses for skill increase of 47% and 45% of respondents, respectively, and 34% of firms indicated that there would be a decline in skills for Banking and Finance Clerks.

TABLE 24: SUMMARY - SELECTED SERVICE INDUSTRIES

Impact of Technology on Skill Levels and Job Content

Occupations	Percent of Organizations								
	Skills Required			Time to Achieve Proficiency			Knowledge of Organization's Operations

• Receptionists and Information Clerks	45	-	55	22	45	33	27	-	73
• All Other Clerks	51	21	29	27	29	44	21	8	72
SALES	72	-	28	60	51	18	79	8	13
• Supervisor: Sales (e.g. Department Manager, Store Manager)	81	7	12	72	7	21	65	-	35
• Insurance Salesmen and Agents	71	6	24	55	9	36	50	-	50
• Other Sales Occupations	100	-	-	89	11	-	89	-	11

Clerks, all of which were expected to require less time to achieve proficiency. The response levels were, however, less than 45%.

Most firms expected technology adoption to increase the need of their employees to have enhanced knowledge of the organization's operations in the Managerial, Administrative and Related and Sales occupations. For most of the Natural Science, Engineering and Mathematics occupations and Clerical occupations, no change in company knowledge because of technology adoptions was expected. The response rates indicating a reduction in the required knowledge of the organization were all insignificant.

5.5 Training Costs and New Technology

Firms in the selected service industries currently estimate spending an average of 2.0% to 6.0% of total labour costs on training. Firms in the Computer Services and Telephone Systems industries spent significantly more than other industries on training as a proportion of total labour costs. Overall, training costs increased most from 1984 to 1985, with less change expected to 1990. In fact, several industries - Computer Services, Chartered Banks, Telephone Systems and Provincial Governments - expected declines between 1985 and 1990.

When asked to allocate the percentage of total training costs related to new technology, a distinctive trend is evident. In all industries, there is expected to be a definite increase in technology training as a percent of total training costs between 1981 and 1995.

The survey results for questions on training costs are shown in Table 25. The table shows there is considerable variability by industry.

TABLE 25: SUMMARY - SELECTED SERVICE INDUSTRIES

		Organizations' Training Costs 1985-1995					Percent of Total Training Costs Related to New Technology (2)				
SIC	Industry	Training Costs as a Percent of Labour Costs (1)									
		Estimated		Expected			Estimated		Expected

(3) Based on expert interviews only.

Exhibit 14, below, compares the service industries investigated to the average of all firms interviewed, in terms of training costs as a percentage of labour costs, and the percentage of training costs related to new technology as higher than average (+), about average (o) or below average (-). It suggests that one industry - Telephone Systems - leads in training persons for new technologies. The industries which appear to be lagging and below average are Insurance Brokers, Chartered Banks and General Insurance.

6.0 LABOUR RELATIONS ENVIRONMENT

This chapter discusses the survey results for firms and unions regarding the labour relations environment in the selected service industries.

6.1 Trends in Unionization

The service sector sample firms indicated a great degree of variation in union representation at an industry level, as shown in Table 26. Federal, Provincial and Local Governments, Telephone Systems (exclusive of Telephone Interconnect firms), and Telegraph and Cable Systems industries were all unionized. However, a number of industries such as the Life and General Insurance, Computer Services and Management and Business Consulting industries had no union representation. Of the Bank and Trust Company respondents, 23% and 28%, respectively, had union representation, but less than 1% of the employees were represented.

Union representation, among organizations with unions, is expected to grow in only one service industry, Telegraph and Cable Systems, from 40% to 50% between 1984 and 1995. The respondents in firms in other industries such as Banks and Trust Companies (1%), Insurance Brokers (15%), Federal Government (85%), Provincial Government (80%), Local Government (85%), Life Insurance (0%), General Insurance (0%), Computer Services (0%) and Management and Business Consultants (0%) expect no change in union representation over the next decade.

TABLE 27: SUMMARY - SELECTED SERVICE INDUSTRIES

Unions and Technology Change		Percent of Organizations with a Union (1)	Percent of Contracts with a Technology Change Clause (1)	Percent of Technology Change Clauses Covering					(1)

(1) Rounded to nearest 5%.
(2) Relatively common among large supermarket chains. Features ranked in order of frequency: consultation, advance notice, job security.
n.a. - not available

6.2 Technology Change Clauses

Table 27 shows the percentage of collective agreements, by industry, which have a technology change clause. As a benchmark for comparison, the percentage of firms with a union(s) is also shown. The table also shows the percentage of the technology change clauses with various features (e.g., notice or job security).

The table shows that, on average, 75% of the service industries with a collective bargaining agreement have a technology change clause, but only about 60% of these clauses cover a statement on advanced notice. More common in the clauses is a commitment to consult the union prior to implementing technology changes affecting employees. Job security is covered by clauses in all industries with technology change clauses in force, being present in about 45% of these clauses. Seniority is another common feature in many industries with union contracts. Provisions for joint management and labour committees are most common in the Federal and Provincial Governments and the Telegraph and Cable Systems Industry.

6.3 Management's Perception of Union's Position on New Technology

Management and union respondents were asked an open-ended question on what the union's position on the adoption of new technologies has been.

An interesting finding is that a high percentage of management responses, in several key industries with a high degree of unionization, acknowledged in their statements that the union accepts the need for new technology. Approximately 50% of the Federal Government, 45% of the Local Government and 50% of the Telegraph and Cable systems management responses cited that the union accepts the need to adopt new technology. In survey research, these high percentage rates, given in response to an open-ended, unbiased question, are considered significant. Similarly, virtually all union respondents in these same industries acknowledged the necessity to adopt new technology.

None of the management responses to this question implied that the union membership accepts new technology while the union leadership resists it. This theme, however, did emerge, at times in some expert interviews.

Management and union responses to the question of the union's position on new technology were also coded to identify different perceptions of the concerns of the union as it relates to technology change. The following list compares the concerns mentioned by management and union respondents from the most commonly to least commonly cited.

Unions Concerns With Technology Change
Ranked in Order of Frequency Mentioned

<u>Management Perceptions of Union</u>	<u>Union Leaders Perceptions of Union</u>
● Job Security	● Retraining
● Retraining	● Job Security
● Impact on Union Membership	● Share of Benefits
● Share of Benefits	● Control of Technology

The results show that the union respondents see retraining as their unions' number one issue. It was mentioned universally, in both the survey and expert interviews with union leaders, as organized labour's most critical concern. Job security was the second most common concern of union leaders. In general, they viewed retraining as the chief measure to reduce the negative effects and to enhance the positive benefits of new technology adoption. Important concerns, but less frequently mentioned by union leaders, were: the desire to gain a share of the benefits of new technology adoption for their members, and the issue of who controls the new technology. An example of the latter concern is electronic monitoring and surveillance of employees.

As can be seen from the above, management perceptions of their unions' chief concerns are close to those of the union leaders. Management sees job security as the unions' number one interest, followed by retraining. Management also perceives that the unions are concerned about their own organizational self interest. Management also perceives that unions want to secure a portion of new technology benefits.

TABLE 28: SUMMARY - SELECTED SERVICE INDUSTRIES
Nature of Worker Involvement in the Process of Technology Change

6.4 Formal Mechanisms for Worker Participation

Organizations in the service industries were asked to indicate whether they had a formal mechanism for worker participation in:

- setting production and/or sales targets at various levels in the organization,
- improving productivity/quality,
- adopting new technology.

The survey results for all firms, by industry, are shown in Table 28.

Overall, the table suggests that:

- Approximately half of all organizations report having some type of formal mechanism for employee participation in setting production and/or sales targets at some level in the organization. The public sector organizations are least likely to have such a mechanism while the incidence in the private sector service firms surveyed, overall, is close to 60%.
- Approximately 55% of all service sector firms surveyed report having some type of formal mechanism for employee participation in improving productivity and/or quality.
- Finally, approximately 45% percent of the service sector firms surveyed report having some type of formal mechanism for employee participation related to adopting new technologies.

(1) Based on expert interviews.

n.a. Not available

Exhibit 15 compares the organizations' responses by service industry as above (+), below (-) or about average (o) in terms of the reported incidence of formal mechanisms for employee participation for the service industries surveyed. It also provides an overall rating in terms of reported mechanisms for employee participation as above or below average for the selected service industries.

In terms of production or sales targets, firms in the following industries are reported most likely to have formal mechanisms at some level in the organization:

- Banks,
- Trusts,
- Brokers,
- Telephone Systems,
- Computer Services, and
- Business Consulting.

In terms of improving productivity or quality, firms in the following industries are reported most likely to have a formal mechanism:

- Trusts,
- Life Insurance,
- Telephone Systems,
- Telecommunications Carriers,
- Computer Services, and
- Business Consulting.

In terms of technology adoption, firms in the following industries are reported most likely to have a formal mechanism:

- Brokers,
- Federal Government,
- Telephone Systems,
- Computer Services, and
- Business Consulting.

TABLE 29: SUMMARY - SELECTED SERVICE INDUSTRIES

To What Extent and How Should Management Involve Workers In Decisions on Adopting New Technology?									
(Percent of Organizations) (1)									
SIC	Industry	Full Involvement	Prior Consultation	Committees	Explanation of Need	Advance Notice	Keep Employees Informed	Training Programs	No Involvement
701	Chartered Banks	60	15	0	25	0	15	0	25
701	Trust Companies	45	10	0	30	0	0	0	15

545	Telegraph and Cable Systems	0	50	0	0	0	50	0	50
853	Computer Services	25	25	25	0	25	0	50	0
867	Management and Business Consultants	10	0	0	0	0	40	50	0
AVERAGE FOR REPORTING ORGANIZATIONS		25	30	15	10	5	20	15	15

(1) Rounded to closest 5%.

Industries with a high percentage of managerial, professional, technical and sales personnel (i.e., Insurance Brokers, Computer Services, Business Consulting) appear consistently to have more opportunities for worker participation. Of the industries with more structured organizations, the Trust and Life Insurance industries appear to have the most opportunities for employee participation.

6.5 Views on Involving Employees in Decisions on Adopting New Technology

Respondents were asked an open-ended question as to what extent and how management should involve employees in decisions on adopting new technology. The responses are summarized in Table 29 by industry and type of response. The responses range from "full" involvement to "no" involvement.

Few union responses were received due, primarily, to their low level of involvement in the service sector. Union responses were received from the Federal Government, Local Government, Telephone and Telegraph and Cable Systems industries. More than half indicated full involvement while all other respondents indicated some degree of participation. No union respondents cited "no involvement" as appropriate.

In general, the service industries, particularly the smaller firms, are characterized by more informal mechanisms for discussion and consultation.

Management expressed a wide range of answers fairly evenly distributed among the categories shown in Table 29.

Full involvement is expressed as desirable by a majority of respondents in the Banking and Insurance industries as well as a large number of Trust Companies.

A few firms indicate that no involvement is preferable, primarily because of the speed at which technological changes are occurring and the specialized knowledge required to decide what technologies are most applicable.

The most common responses show a preference for prior consultation and keeping employees informed of the decision making and/or the implementation of any changes in technology adoption.

Several cautionary notes should be applied in reviewing Table 29.

1. The survey results show how specific managers in a sample of firms in each industry feel about employee involvement. It does not indicate how firms act.
2. Table 29 attempts to identify industry patterns and, as such, masks how individual firms within a single industry view employee involvement. As Table 29 demonstrates, there are variations within a single industry.
3. The results should not be viewed as statistically significant for this question because the sample of firms in any one industry was relatively small, and not all respondents provided an answer to this question. Furthermore, the sample and sample frame was structured by employment size, not by a firm's attitude towards industrial labour relations.

7.0 PLANNING FOR TECHNOLOGICAL CHANGE

The following chapter reports the results of the survey regarding questions related to planning for technology change. Table 30 summarizes the results.

7.1 Long-term Strategic Plan

Of the firms surveyed, 63% have long-term strategic plans. The firms with the highest positive response rates were in the Banks (100%), the Telegraph and Cable Systems (100%), the Federal Government (87%), the Management and Business Consultants (81%) and Life Insurance (79%) industries. Local governments are the least likely to have a plan (19%).

7.2 Human Resource Plan

Over 55% of the firms in the selected Service Industries surveyed reported having a human resource plan. The average length of the planning horizon is six years.

Firms most likely to have a plan are in the Telegraph and Cable Systems (100%), Chartered Banks (91%), Federal Government (87%) and General Insurance (72%) industries.

The firms least likely to have a human resource plan are in the Telephone Systems (20%), and Local Government (40%) industries.

7.3 Capital Investment Plan

Less than 50% of the firms have capital investment plans dealing with new technologies. The average planning period for firms with such plans is five years. The most likely firms to have capital investment plans are in the Telegraph and Cable Systems

TABLE 30: SUMMARY -- SELECTED SERVICE INDUSTRIES

		Planning for Technological Change				
SIC	Industry	Strategic Plan	Human Resource Plan		Capital Investment Plan	Perceived
		Percent of Organizations With Plan	Percent of Organizations With Plan	Length of Planning Horizon (1) (Years)	Percent of Organizations With Plan	Integration Between Capital and Human Plans (2)
701	Chartered Banks	100	91	6	72	3.8
701	Trust Companies	73	53	5	25	4.5
721	Life Insurance	79	52	4	31	2.2
721	General Insurance	75	72	6	59	2.6
735	Insurance Brokers	46	61	5	42	3.0
909	Federal Government	87	87	4	87	2.1
931	Provincial Government	71	57	4	57	2.8
951	Local Government	19	40	5	40	1.3
544	Telephone Systems and Interconnects	67	20	6	36	2.6
545	Telegraph and Cable Systems	100	100	7	100	3.8
853	Computer Services	40	40	4	20	5.0
867	Management and Business Consultants	81	54	4	23	4.2
	AVERAGE FOR REPORTING ORGANIZATIONS	63	56	5	44	2.8

(1) Rounded to closest percent.
 (2) Counts 1984-1985 as one year.
 (3) Using a scale of 1 to 5: 1 represents "Not at all integrated" and 5 "Highly integrated".

(100%), Federal Government (87%) and Chartered Bank (72%) industries. Those firms least likely to have capital plans are in the Computer Services (20%), Management and Business Consultants (23%) and the Trust Company (25%) industries.

7.4 Perceived Integration Between Capital and Human Resource Plans

On average, firms in the Service Industries indicated a modest degree of integration between their human resource and capital investment plans. The overall average for the Service sector is 2.8 on a scale of 1 ("not at all integrated") to 5 ("highly integrated"). Therefore, a rating of 3, in the middle of the scale, would represent a fair degree of integration.

The firms with the highest level of integration are in the Computer Services (5.0), Trust Companies (4.5) and Management and Business Consultants (4.2) industries. It is interesting to note that these industries also indicated low responses to having plans. It seems that those that do plan, in these industries, have a high degree of integration between human resource and capital plans.

The public sector showed a low level of integration overall, with Local Government rating its plans as the least integrated.

7.5 Conclusion

Exhibit 16 summarizes the planning capability of the firms in each industry as above (+), below (-) or about average (o), relative to the average for all service industries surveyed on the questions asked. In addition, each industry is rated in terms of its overall planning capability.

Five industries achieved strong ratings: Chartered Banks, General Insurance, Federal Government, Telecommunications and Retail Food. The weakest industry in terms of planning capability was Local Government.

COMPARISON OF PLANNING CAPABILITIES

SELECTED SERVICE INDUSTRIES

DESCRIPTION OF SAMPLE FRAME

BANKS AND TRUSTS SIC 701

The sample frame for the survey of this industry included chartered banks and trust companies with fifty (50) or more employees in Ontario.¹ Employment in these financial institutions (i.e., 50 or more employees) are estimated to include 99% of the approximately 64,200 employees working in banks and 20,000 employees working in trust companies in Ontario.

<u>Sample Frame</u>			
	701		701
	<u>Banks</u>		<u>Trusts</u>
Small (50-199)	7		11
Medium (200-999)	4		6
Large (1,000+)	<u>5</u>		<u>5</u>
Total	16	Total	22

1. The source for banks was the Canadian Bankers' Association. Through a telephone survey, banks with 50 or more employees in Ontario were identified.

The Source for trust companies was the Report of the Registrar of Business of 1981, Loan and Trust Corporations, 85th Report, Ontario Ministry of Consumer and Commercial Relations. Through a telephone survey, trust companies with 50 or more employees in Ontario were identified.

INSURANCE CARRIERS SIC 721

The sample frame for the Insurance Industry survey of life and general insurance carriers included all firms with a base of operation in Ontario and \$10 million or more in annual premium incomes in Ontario. Employment in these firms is estimated to represent 90% of the 31,200 Ontario employees in the life insurance industry and 95% of the 20,000 Ontario employees in the general insurance industry.⁽¹⁾

INSURANCE BROKERS (PART OF SIC 735)

The survey sample frame for insurance brokers included all firms with fifty (50) or more employees. These firms represent only about 20% of Ontario employment in this industry as it is dominated by a large number of small firms.⁽²⁾

-
- (1) The source for life insurance companies and premium data (1981) was the Annual Report of the Superintendent of Insurance for Ontario, 1982, Ontario Ministry of Consumer and Commercial Relations. Ontario-based firms were established through the directory listing in the May, 1984, statistical issue of the Canadian Underwriter.

The source for general insurance companies and premium data (1983) was the May, 1984, statistical issue of the Canadian Underwriter. These data excluded accident sickness, and reinsurance premium income. Ontario-based firms were established through directory listing in the same issue.

- (2) The source for insurance brokers was the directory of the Registered Insurance Brokers of Ontario (RIBO). RIBO supplied a distribution of firms by employment size, but was unable to provide a list of firms by size. For this latter information, the 1984 Dunn & Bradstreet file was used.

		<u>Sample Frame</u>		
		<u>721 Life Insurance Carriers (1)</u>	<u>721 General Insurance Carriers (1)</u>	<u>735 Insurance Brokers</u>
Small	(50-199)	7	27	39

Large	(1,000+)	14	2	0
Total		<u>26</u>	<u>51</u>	<u>45</u>

(1) Estimated by correlating actual Ontario employment of insurance carriers sampled to data on Ontario premium income of carriers in sample frame.

PUBLIC ADMINISTRATION SIC 901, 931, 951

For the survey of federal (SIC 909)¹ and provincial (SIC 931)² public administration, government departments were treated as separate organizations and structured by employment size category. Federal government departments with 500 or more employees in Ontario, and provincial ministries with 200 or more employees³ were included in the sample frame. In both the federal and provincial governments, a few departments, which are dominated by occupations not selected for study by the Task Force, were excluded.⁴ The departments in the sample frame represent 76% of the approximately 91,000 federal⁵ and 80% of the approximately 84,000 provincial public administration employees in Ontario.

For the survey of municipal governments (SIC 951), the sample frame included all Ontario municipal corporations with 500 or more employees.⁶ These larger local governments include 78% of the 107,500 municipal employees in Ontario.

1. SIC 909 "Other Federal Administration" excludes National Defense - enlisted and civilian personnel (which is SIC 902) and Canada Post (which is SIC 548).
2. SIC 931 excludes hospitals, educational institutions, and Crown Corporations such as Ontario Hydro.
3. Ministry stratification included classified civil servants (full-time, permanent civil servants) only. It excluded Crown employees, casual, contract and seasonal employment.
4. A few departments, dominated by occupations not selected for investigation by the Task Force, were excluded from consideration in the survey.

In the Federal Government, the following Departments were excluded from consideration: Justice, Royal Canadian Mounted Police and Correctional Services. In the Provincial Government, the following Ministries were excluded from consideration: Attorney General, Solicitor General and Correctional Services.

	22	19	39

n.a. Not applicable

* Includes Workers' Compensation Board.

-
5. The 1981 Census reports 105,400 employees resident in Ontario and working in SIC 909. The 91,000 figure is based upon a special run by the Public Service Commission of Canada, "Population Reporting File", September, 1984" and reflects place of work data.
 6. Includes upper tier (i.e., counties, regional and metropolitan municipalities) and lower tier governments (i.e., cities, boroughs, towns, villages).

Note: The percentage figures indicate the share of all federal employees in departments with 500 or more employees in Ontario and the share of all provincial employees in ministries with 200 or more employees. The estimate of federal employees in Ontario is from the "Population Reporting File", September, 1984, Public Service Commission. The estimate of provincial employees in Ontario is the Ontario Public Service Commission, March, 1984, plus employment in the Ontario Workers' Compensation Board. Provincial employment includes classified, unclassified and Crown employees.

TELEPHONE SYSTEMS SIC 544

The sample frame for the Telephone Systems Industry included all telephone systems¹ and telephone interconnect firms² with twenty (20) or more employees in Ontario. Employment in the sample frame firms is estimated to represent 99% of the approximately 27,000 Ontario employees in telephone system companies and 86% of the approximately 3,300 Ontario employees in telephone interconnect companies.

TELECOMMUNICATIONS CARRIERS SIC 545

The sample frame for the Telecommunications Industry included all four telecommunications carriers in Ontario.³ These firms represent 100% of the approximately 2,500 Ontario employees in this industry.

SAMPLE FRAME

		<u>Telephone Systems 544</u>			<u>545</u>
		<u>Systems</u>	<u>Interconnects</u>	<u>Total</u>	<u>Telecommunications</u>
Small	(20-199)	3	27	30	2
Medium	(200-999)	2	4	6	1
Large	(1,000+)	<u>1</u>	<u>0</u>	<u>1</u>	<u>1</u>
Total		6	31	37	4

1. The source for telephone systems was the Ontario Telephone Service Commission, 1983 Annual Report. A telephone survey identified companies with 20 or more employees in Ontario.
2. The source for telephone interconnect firms and employment was the Canadian Interconnect Directory, Northern Business Information Limited, 1984.
3. The source for these firms is Telecommunications Statistics, Catalogue No. 56-201. Employment was established through a telephone survey.

GENERAL MERCHANDISE SIC 642

The sample frame for the General Merchandise Industry included all organizations with 100 or more employees.¹ These organizations in the sample frame represent approximately 83% of all employment in this industry in Ontario.²

RETAIL FOOD STORES SIC 631

The sample frame for Retail Food Stores includes all organizations with 100 or more employees in Ontario.³ The sample frame organizations together have about 97% of the approximately 88,000 Ontario employees in this industry.⁴

	631	642
	<u>Food Stores</u>	<u>General Merchandise</u>
Small (20-99)	15	1
Medium (200-999)	17	2
Large (1,000+)	<u>13</u>	<u>9</u>
	45	12

1. The source for organizations was the Retail Trade Section of Statistics Canada. Employment per organization was determined through a telephone survey.
2. The 1981 Census reports 103,160 Ontario residents employed in SIC 642.
3. The source for companies was the Canadian Grocer, August, 1983. Estimates of employment utilized a combination of a telephone survey and estimate procedure which multiplied the number of outlets times an average number of employees per store, using Dun & Bradstreet data.
4. The 1981 census reports 92,385 residents employed in SIC 631 in Ontario.

COMPUTER SERVICES SIC 853

The sample frame for the survey of Computer Service firms included full members of the Canadian Association of Data Processing (CADAPSO) with operations in Ontario.¹ These firms are estimated to include approximately 70% of the sales in the industry.²

Sample Frame

	853 Computer Services	867 Business Consulting
Small (under 200)	36	32
Medium (200-999)	5	8
Large (1000+)	<u>0</u>	<u>0</u>
	41	40

MANAGEMENT AND BUSINESS CONSULTANTS SIC 867

The Management and Business Consultants Industry (SIC 867) included consultants in actuarial, personnel, customs, economics, public relations and management services.

The sample frame includes all firms with twenty (20) or more employees in Ontario.³ These firms (i.e., with 20 or more employees) represent approximately half of the 11,000 Ontario employees in this industry.⁴

1. Ontario operations were identified through CADAPSO membership files and telephone directories. Employment of individual firms was estimated by correlating a sample of firms using Dun & Bradstreet data on employment with revenue data from CADAPSO.
2. The 1981 Census shows 16,775 residents employed in SIC 853 in Ontario.
3. The source for these firms includes members of the Canadian Association of Management Consultants, The Financial Post 500, Summer 1984, the Canadian Public Relations Society, Dun & Bradstreet and the Canadian Association of Customs Brokers. Employment data were supplemented through telephone surveys.
4. The 1981 Census shows 10,975 residents employed in SIC 853 in Ontario.

RELIABILITY OF THE SAMPLE

SAMPLE RELIABILITY

The sample reliability is summarized with other sample and population characteristics in "Table 1". The sample was selected as a three stage stratified random sample. The purpose of this stratification was to reduce the error variance in the measurement of organization size by increasing the homogeneity of each group of organizations within each strata.

The first stage consisted in creating two industry sectors (i.e. manufacturing and services). The second stage involved dividing up each industry sector into nine and fourteen industrial sub-classes respectively and according to Standard Industrial Classification codes (see Table 1). The third stage was to further stratify each SIC into three more homogeneous size groups:

<u>Manufacturing Sector</u>		<u>Service Sector</u>
Small	20- 99 employees	20-199 employees
Medium	100-499 employees	200-999 employees
Large	500+ employees	1,000+ employees

Exceptions to these three size groupings are as follows:

<u>SECTOR</u>		<u>ORGANIZATION SIZE EXCLUSION</u>
Manufacturing Sector		
291	Iron & Steel Mills	less than 500
321	Aircraft & Aircraft Parts	less than 50
Service Sector		
701	Banks and Trusts	less than 50
721	General and Life Insurance	less than 50
735	Insurance Brokers	less than 50
909	Federal Government	less than 500
931	Provincial Government	less than 200
951	Local Government	less than 500

Overall, the sample yields a relatively high reliability level in reflecting the employment level of those sectors surveyed. For instance, for the Chartered Banks Industry, the sample yields a minimum confidence level of about 95 percent with an associated allowable error of 5 percent. That is, we would expect that the estimated employment level for the sector has a 95 percent chance of being within ± 5 percent of the actual employment level found in the frame. Or stated alternatively, if 100 independent random samples were drawn, in 95 of these samples we would expect to have an estimated employment level within ± 5 percent of the actual employment level found in the sample frame.
